

The Brain

LABEL THE KEY AREAS

Learning Points

ONE

Describe the overall role of the brain.

TWO

Label the key areas of the brain.

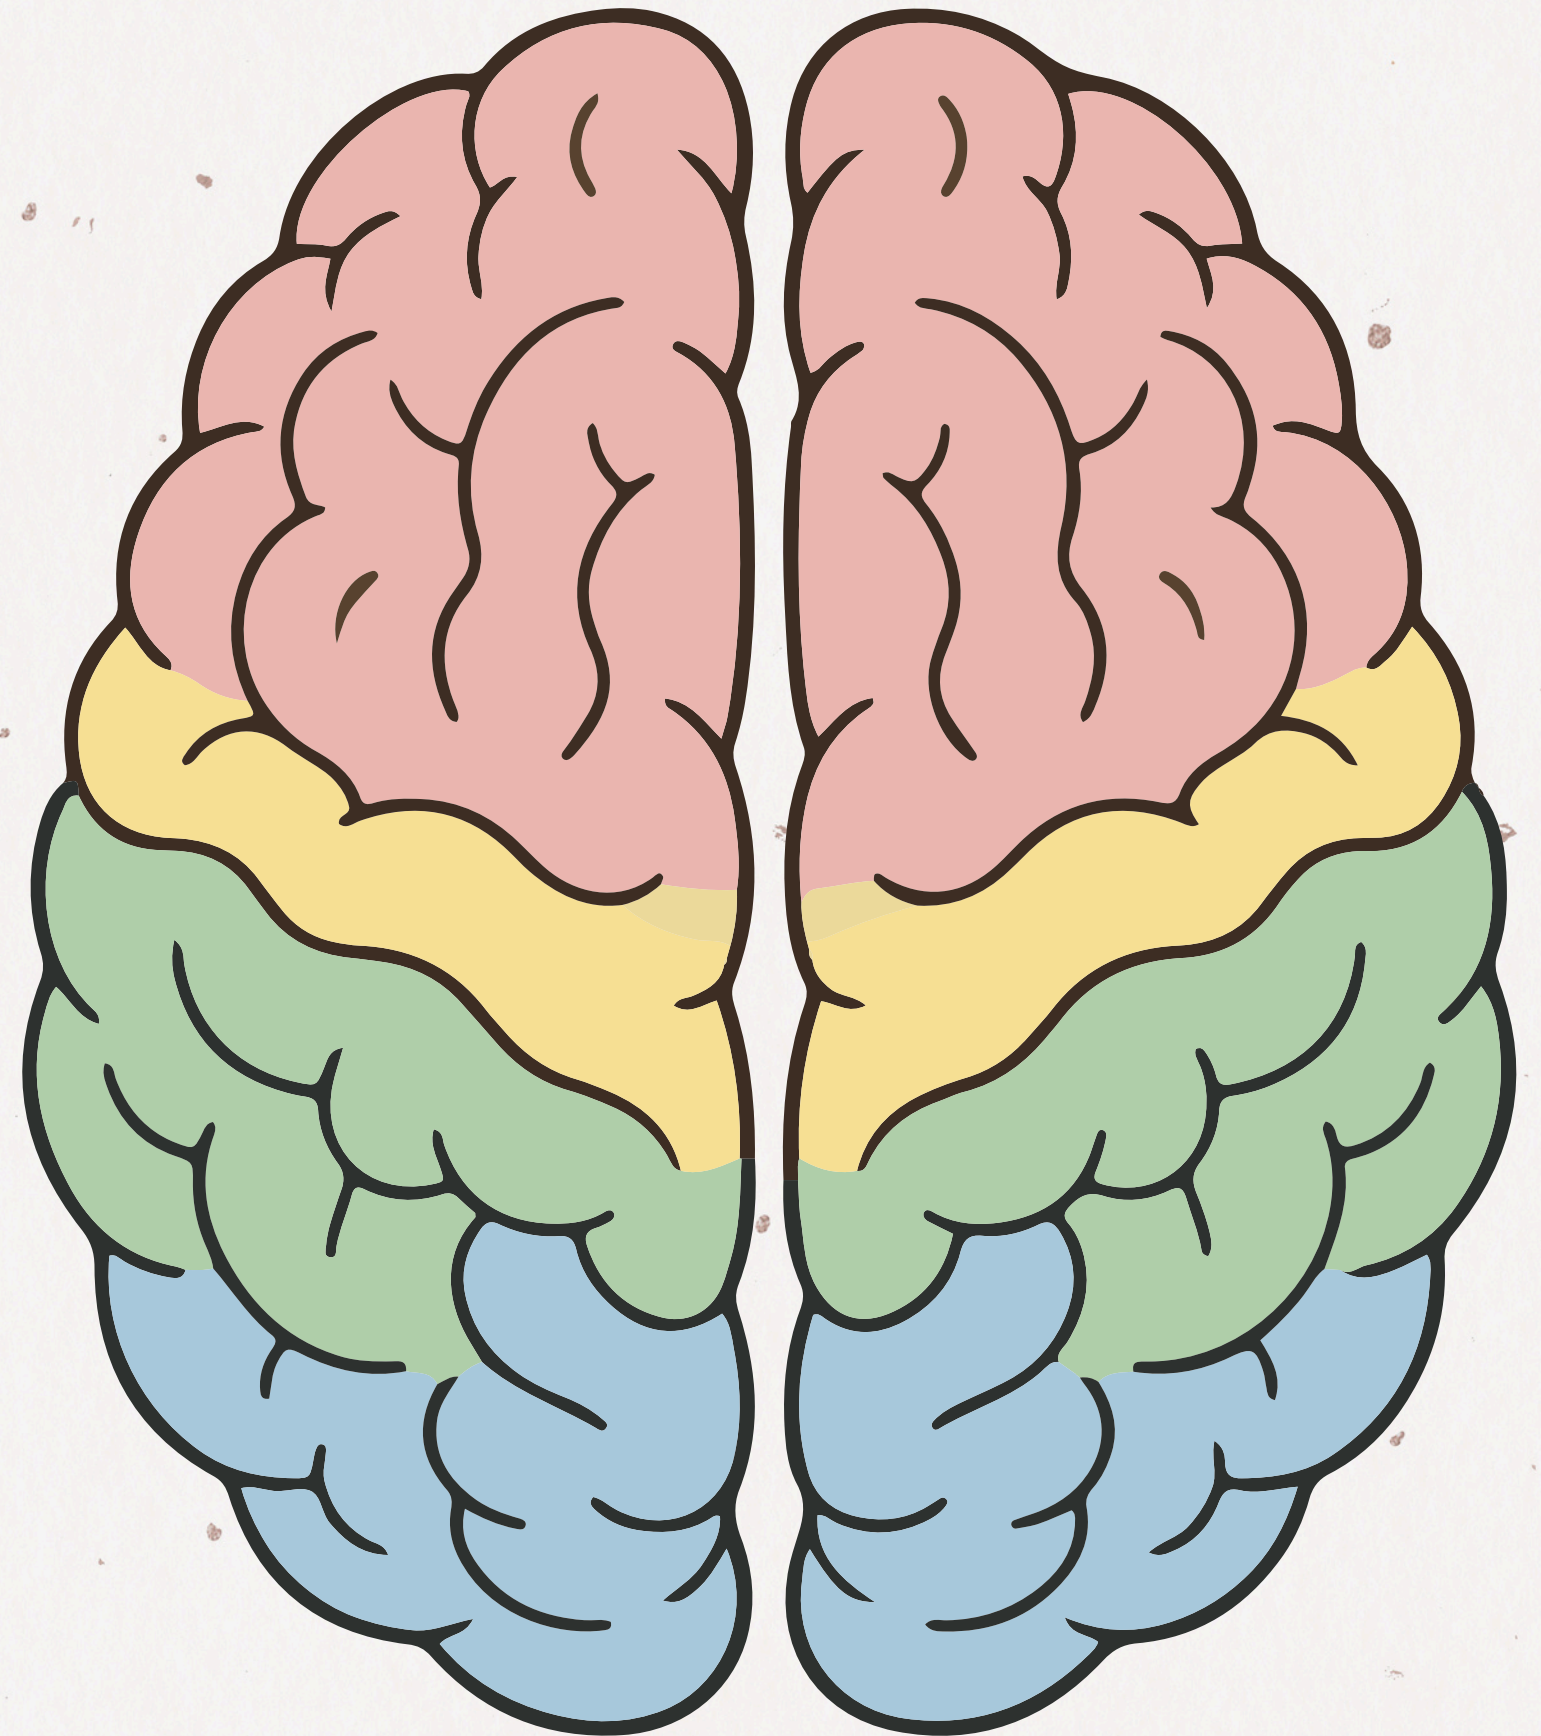

THREE

Explain what each key area of the brain does.

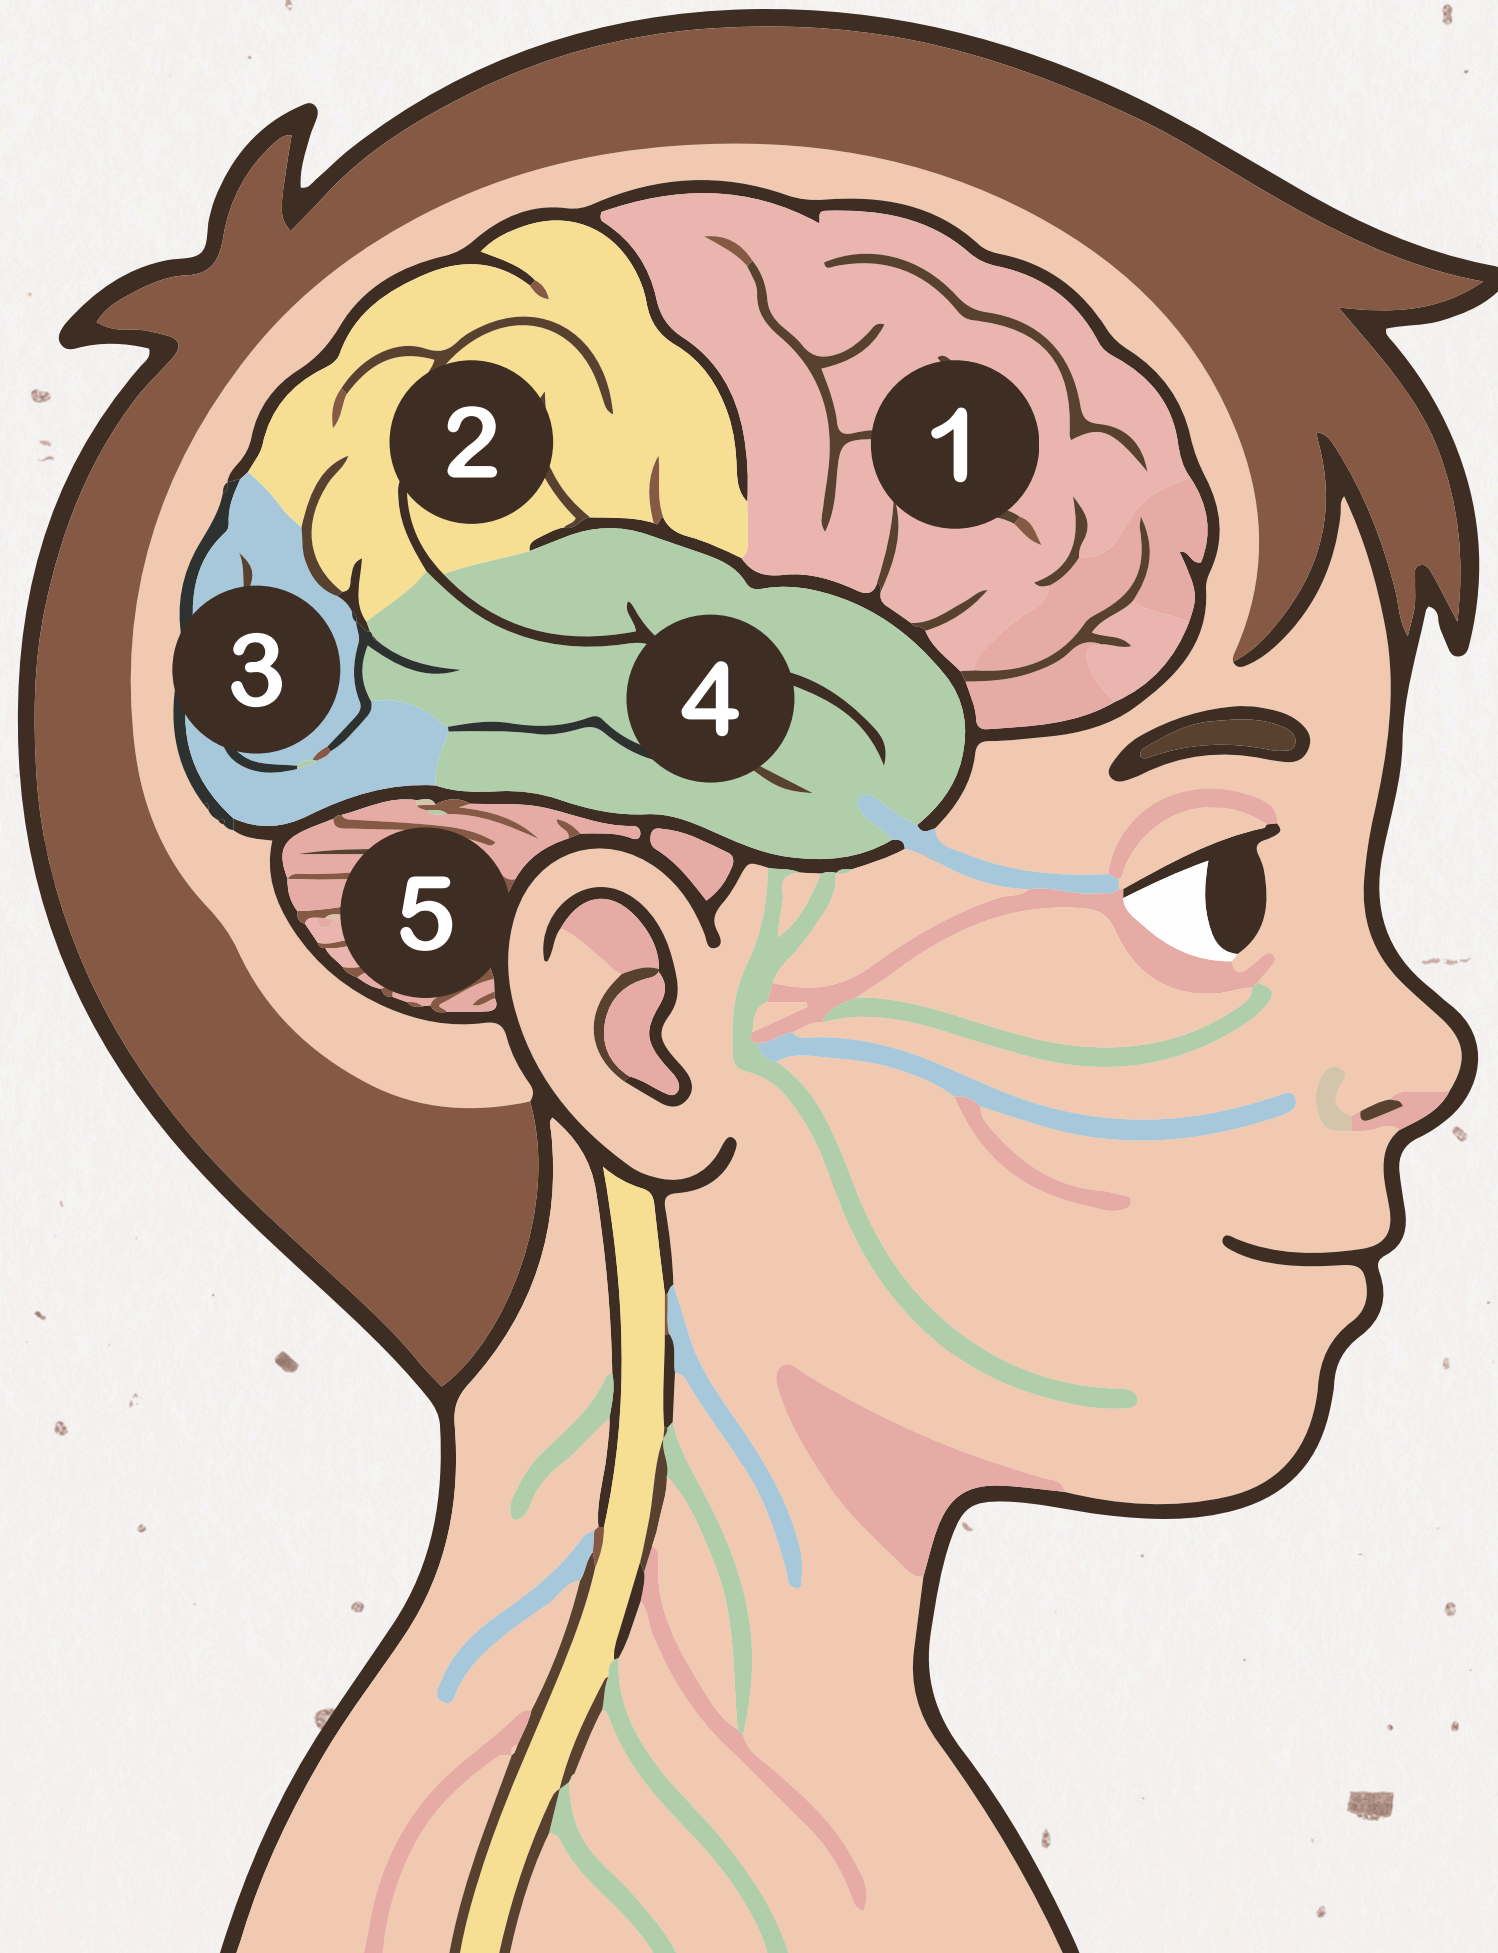

Role

The brain is a complex organ found in the skull. It controls every regulatory process in the human body.

It controls movement, touch, thoughts, emotions, breathing, body temperature and much more.

Key Areas

- 1 Frontal lobe
- 2 Parietal lobe
- 3 Occipital lobe
- 4 Temporal lobe
- 5 Cerebellum

1 Frontal Lobe

- Controls cognitive skills (e.g. judgement, memory, speech, learning, reasoning and problem solving)
- The left side controls voluntary muscle movements on the right side of the body (and vice versa)

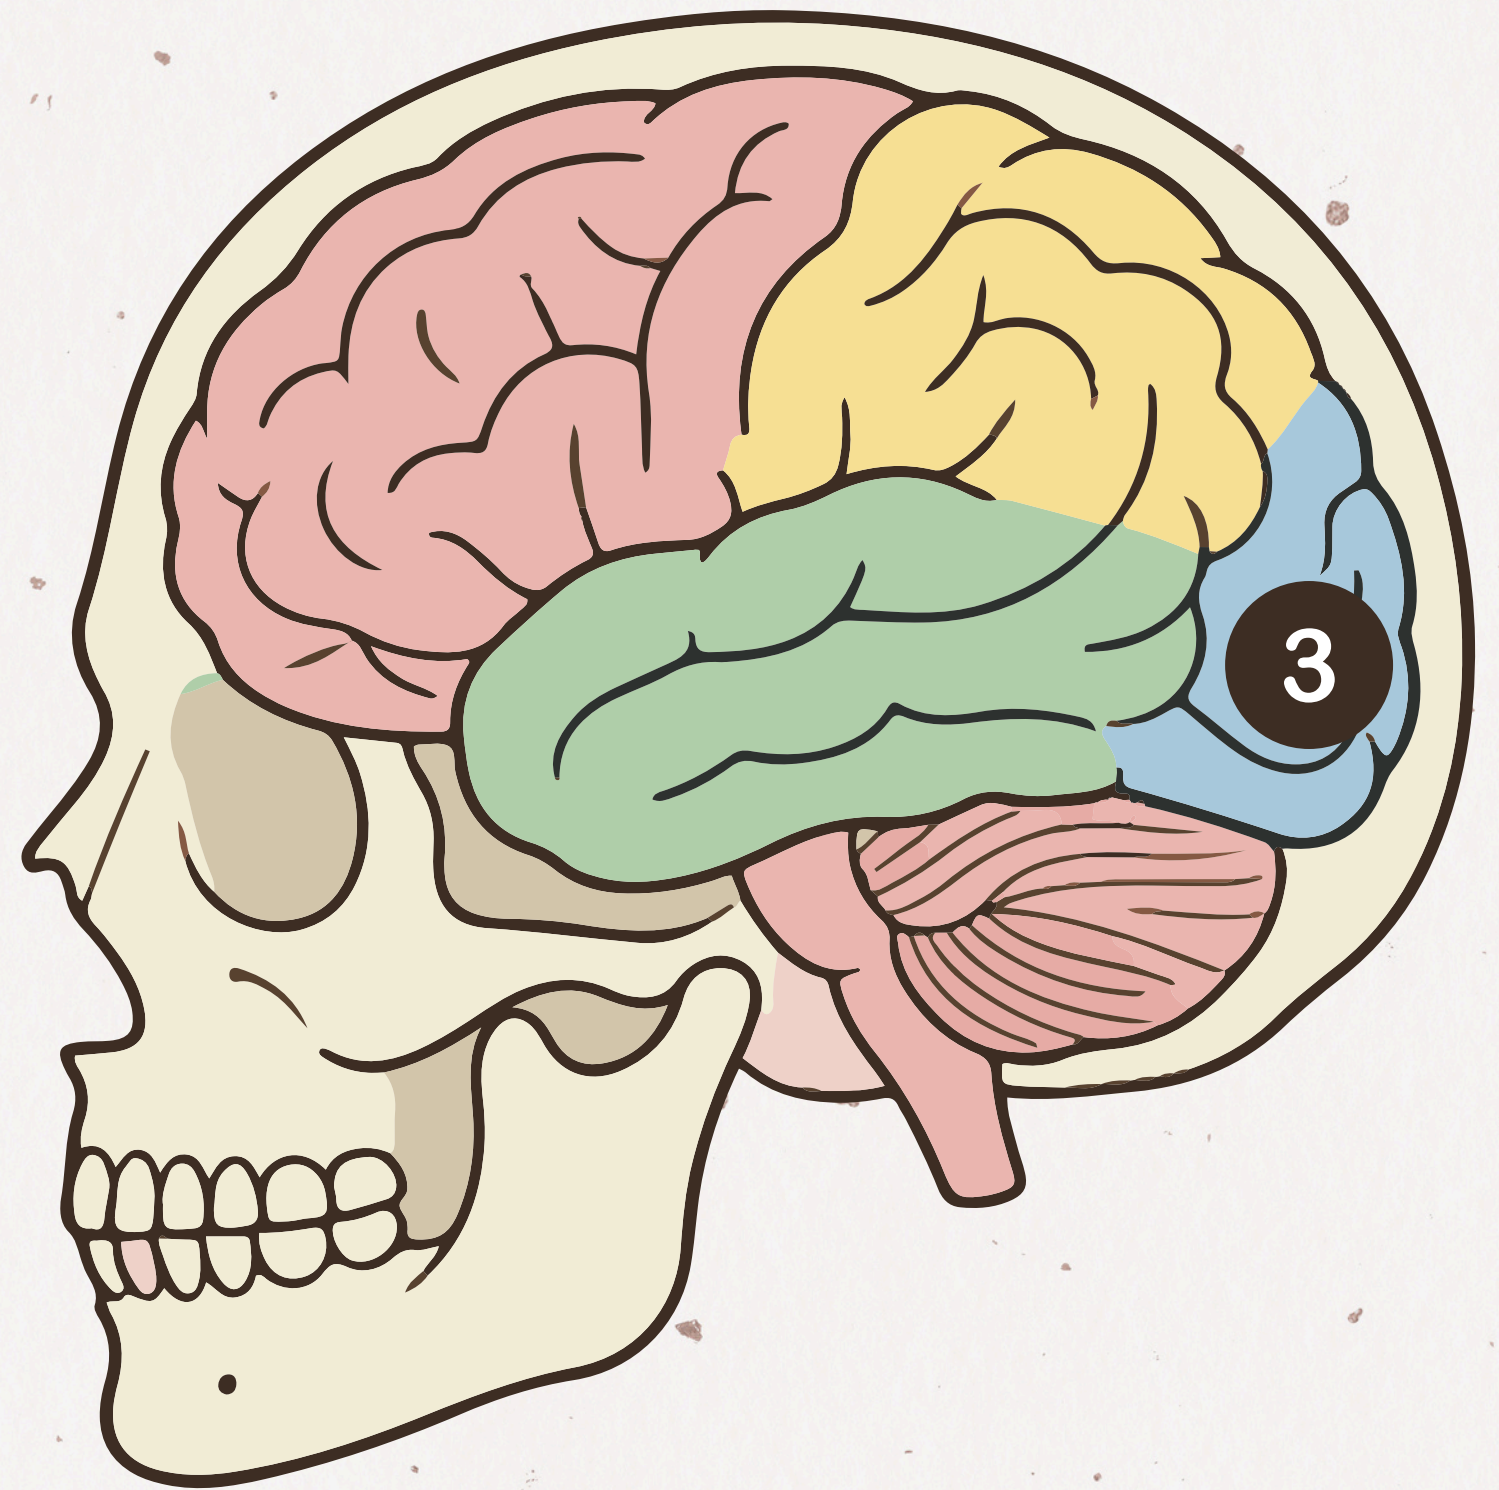

2 Parietal Lobe

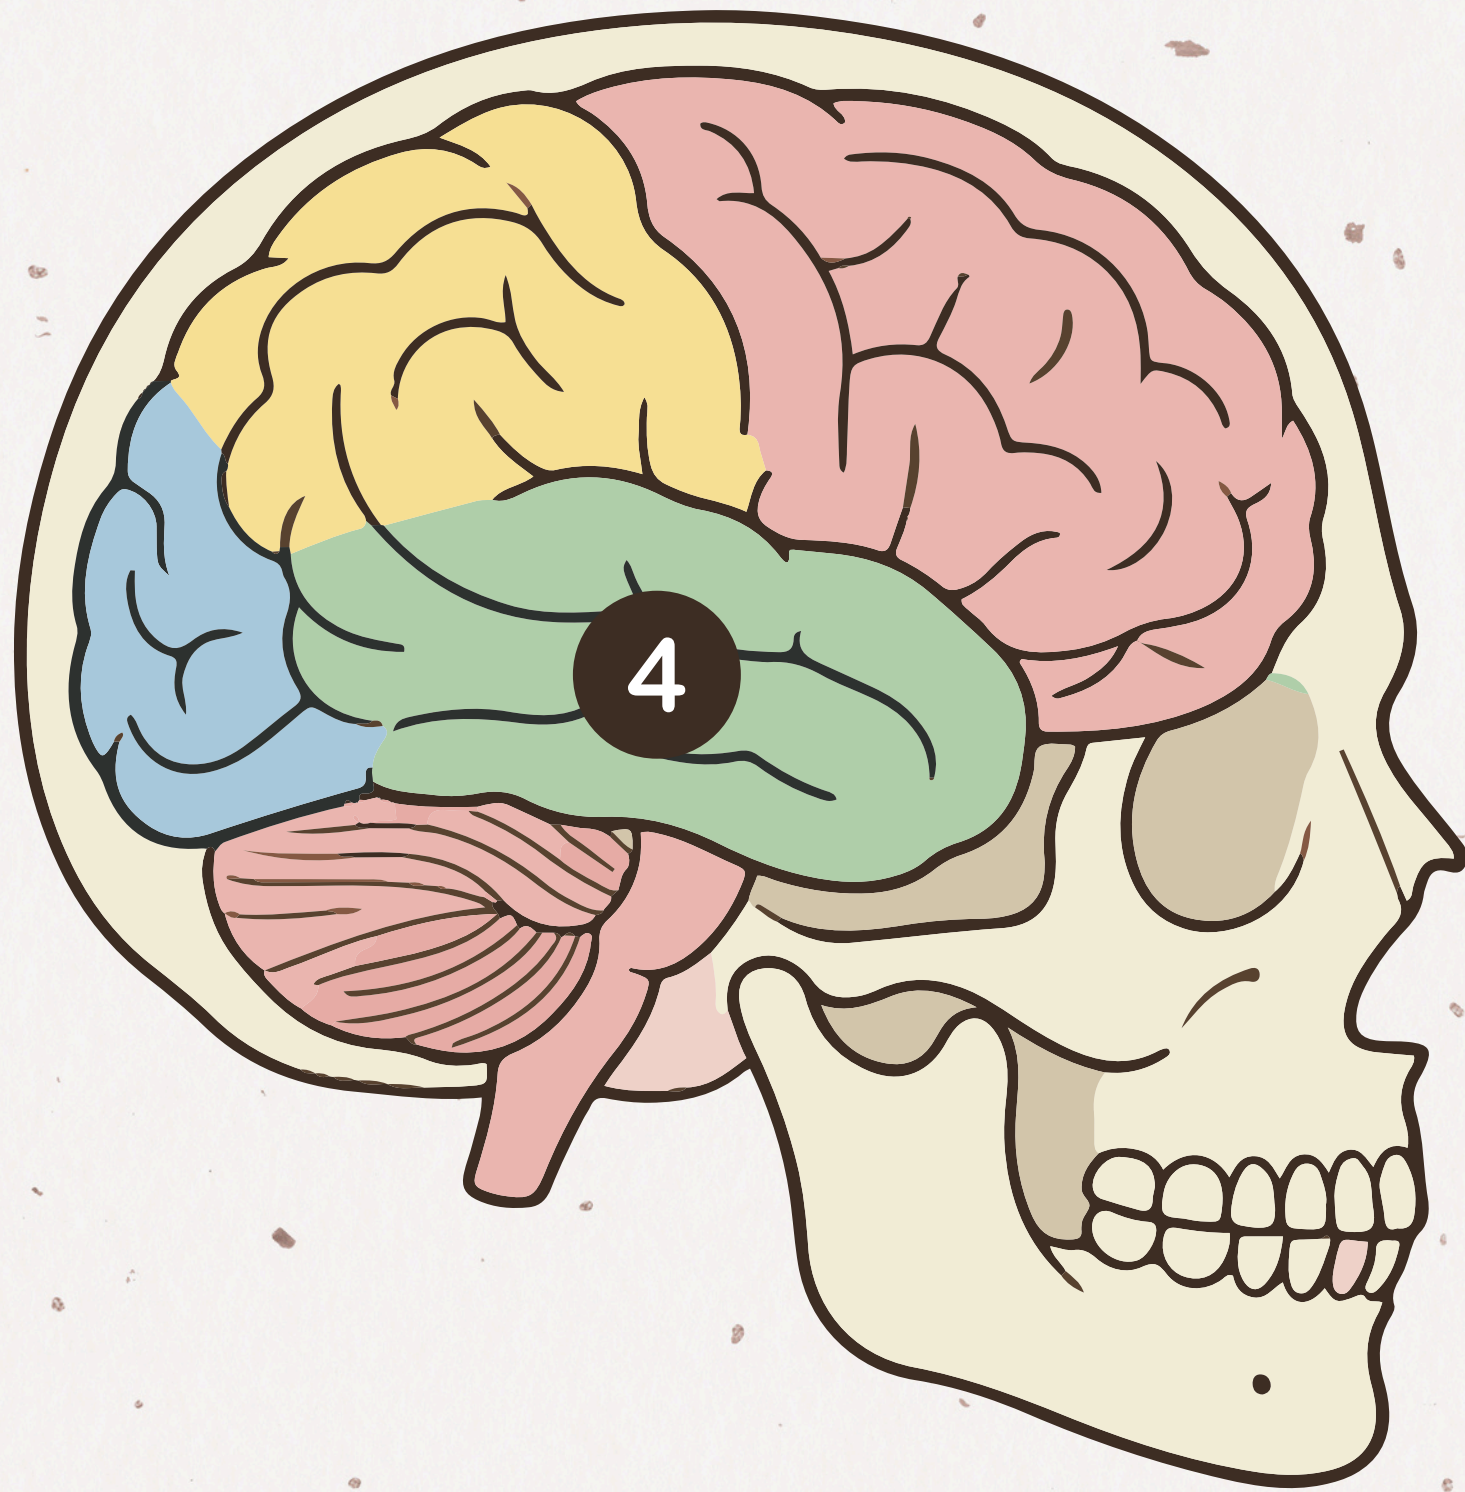

- Organises sensory information and processes sensations such as touch, temperature and pain
- Allows us to write, categorise objects and locate things around us

3 Occipital Lobe

- Helps us to recognise and understand what our eyes see
- Aids in identifying 3D space, shapes, movement, places, colours and faces

4 Temporal Lobe

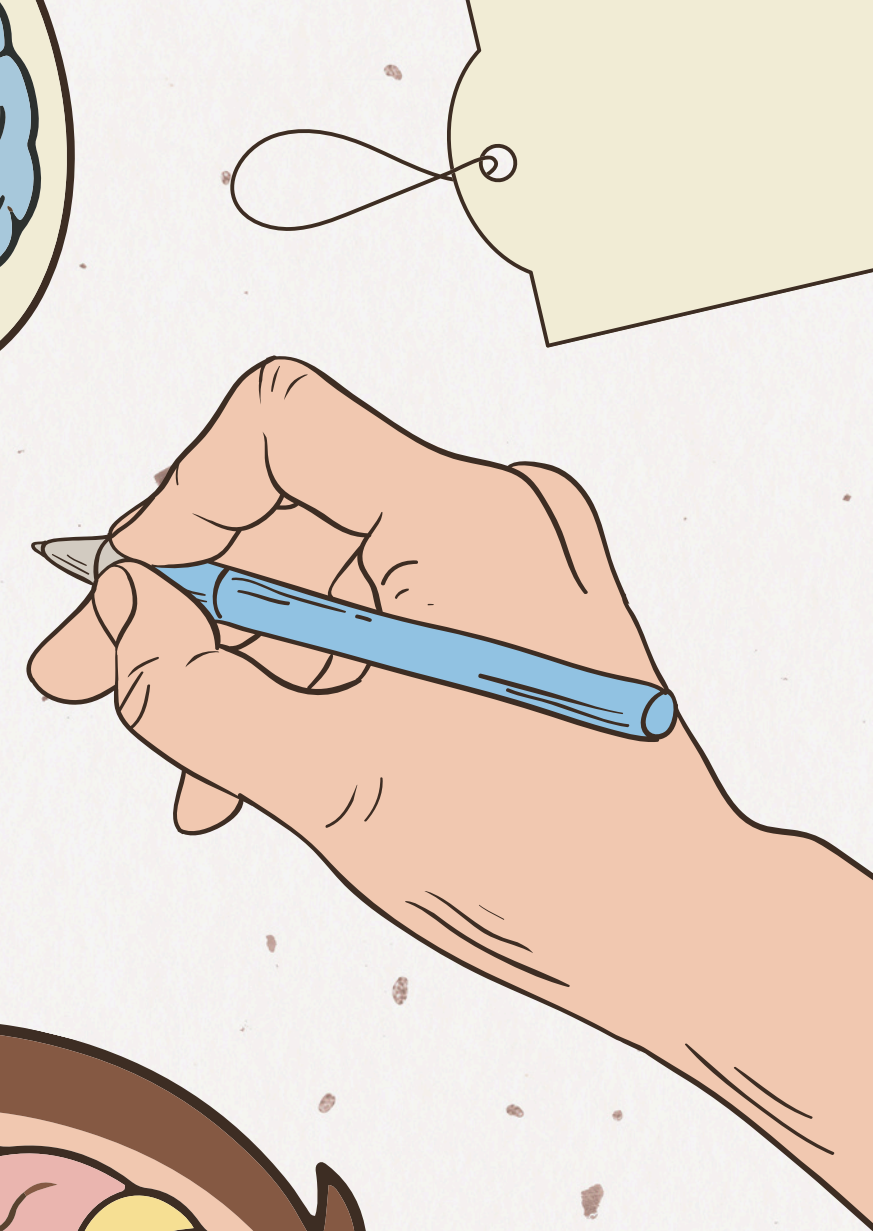

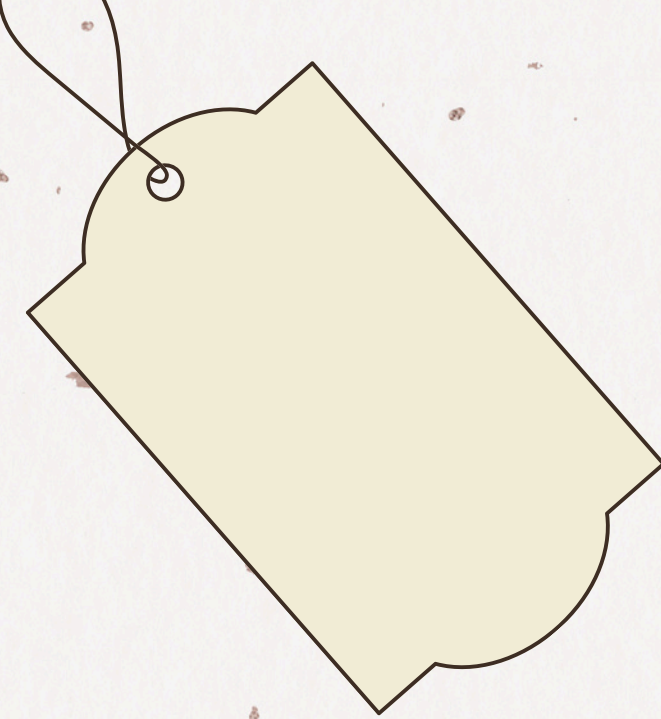

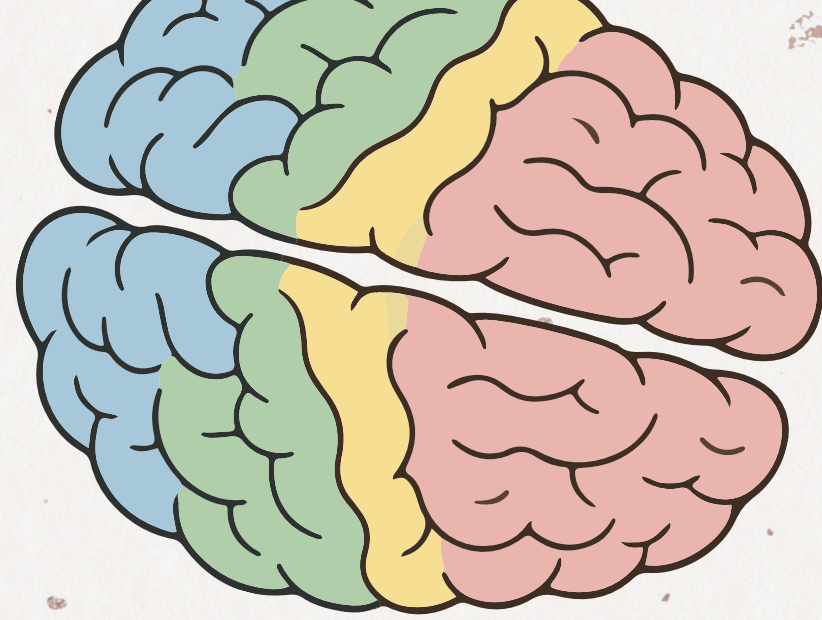

- Supports memory and helps us understand the meaning of words
- Helps us to process emotions and alerts us to danger

5 Cerebellum

- Coordinates movement and maintains balance
- Controls eye movement and visual tracking to light and sound

The End
THANK YOU
